

Usability Evaluation Report

Module: Software Testing

Assignment: Heuristic Evaluation

Project: ClassIQ

Name: Hathadura Chathurika Silva

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple and natural dialog	The welcome screen contains many background illustrations around the login area. The main action is visible, but the extra decoration can distract a first-time user from the login flow.		2	Reduce the strength of the background image around the centre area and make the Login button the strongest visual element.
2	H1-2: Speak the users' language	Some wording is not fully natural for a school system. For example, the role cards say I am a Teacher and I am a Student, but the screen gives no short instruction about which login details should be used.		2	Use simple school-based wording such as Teacher Login and Student Login, and add small helper text for username and password fields.
3	H1-3: User control and freedom	The student dashboard has Back and Logout controls, but the main navigation buttons do not clearly show which section the user is currently in.		2	Add a page title or active section indicator after opening a module, so users know where they are.
4	H1-4: Consistency and standards	The Back, Logout, Download PDF, Save, and Clear buttons do not always use the same size, colour strength, and placement. This makes the interface feel less consistent between pages.		2	Create one common button style for primary, secondary, and danger actions, and reuse it on every page.
5	H1-5: Aesthetic and minimalist design	Term dates, holidays and rules are placed inside one long scroll panel. Important information may be hidden below the visible area.		2	Separate the information into clear cards or sections and keep the most important dates visible without scrolling.
No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
6	H1-6: Recognition rather than recall	Students and teachers must remember what each large icon means after leaving the dashboard. Some modules use icons first and text second, so the purpose may not be recognised immediately.		2	Keep clear labels under every icon and use short descriptions such as View marks, Enter marks, and Write feedback.

7	H1-7: Flexibility and efficiency of use	The Students page includes search, but it can be improved for faster work. A teacher cannot clearly open a profile using quick actions such as pressing Enter or double-clicking a row.		2	Add live filtering, Enter-key search, and double-click row opening to reduce the number of steps for frequent users.
8	H1-8: Error prevention	The mark sheet shows untranslated resource key names such as table.student_no, table.total, table.grade, button.save, and button.clear. This looks like a system error to the user.		3	Fix the missing language keys before final submission and test every language file after adding or renaming UI labels.
9	H1-9: Prevent errors	Unentered marks appear as 0 in the marks table. This can make the teacher think that the student received zero marks instead of the mark simply not being added yet.		3	Show blank cells or Not Entered for missing marks, and ask for confirmation before saving zero marks.
10	H1-10: Help users recognize and recover from problems	On the Student Details page, the permission message appears far below the feedback box, while Edit and Save buttons still look available.		2	Place the permission message next to the disabled controls and visually disable unavailable buttons.
